

Draw a line perpendicular to a given line from a given point

- 1st** Swing an arc from the given point that cuts the given line in two places. This means your compass must have a radius that is greater than the distance from the point to the line.

- 2nd** Swing arcs below the line from each of the places where the arc intersects the line.

- 3rd** Draw a line connecting the point to the intersecting arcs. This line is perpendicular to the given line.
