The Pythagorean Theorem and Its Converse

Unit 8 Lesson 1

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Students will be able to:

Study the Pythagorean theorem and its converse and use it to identify right triangles

## Key Vocabulary:

- Right triangle
- Pythagorean theorem
- Converse of Pythagorean theorem

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

A Right-angled triangle(named as right triangle) is a triangle which has one of its angles equal to 90 degrees.

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

There are properties associated with a right triangle.

- A hypotenuse is the line segment opposite to the right-angle.
- An opposite is the line segment opposite to the angle $\Theta$.
- An adjacent is the line segment next to the angle $\Theta$.

- The sum of three angles is $180^{\circ}$ i.e. $\theta+\phi+90^{\circ}=180^{\circ}$

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Pythagorean Theorem

In a right-triangle, the sum of the squares of the lengths of adjacent and opposite is equal to the square of the length of hypotenuse.

$$
c^{2}=a^{2}+b^{2}
$$

Where,
c = Hypotenuse
a = Opposite

$b=$ Adjacent

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Problem 1: Find the unknown length $\boldsymbol{x}$ in the right triangle shown.

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Problem 1: Find the unknown length $\boldsymbol{x}$ in the right triangle shown.

By Pythagorean theorem,

$$
\begin{gathered}
c^{2}=a^{2}+b^{2} \\
13^{2}=x^{2}+12^{2} \\
x^{2}=169-144 \\
x^{2}=25 \\
\rightarrow x=5
\end{gathered}
$$

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Converse of Pythagorean Theorem

If the sum of the squares of the lengths of adjacent and opposite is equal to the square of the length of hypotenuse, then the triangle is a right triangle.

$$
c^{2}=a^{2}+b^{2} \quad \square \triangle A B C \text { is a right triangle }
$$

Where,
$c=$ Hypotenuse

a = Opposite
b = Adjacent

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Problem 2: Identify if the triangle shown is a right triangle or not.

## THE PYTHAGOREAN THEOREM AND ITS CONVERSE

## Problem 2: Identify if the triangle shown is a right triangle or not.

To show if the triangle is a right triangle, we need to check whether its lengths satisfy the Pythagorean theorem:

$$
\begin{aligned}
& c^{2}=a^{2}+b^{2} \\
& 10^{2}=8^{2}+6^{2}
\end{aligned}
$$

$$
100=64+36
$$

## $100=100$

So, the triangle is a right triangle.
